CATALOGUE

OF

NON-HERBACEOUS PHANEROGAMS

Cultivated in the Royal Botanic Garden, Calcutta.

PART I (NUMERICAL LIST)

BY

A. T. GAGE, Major, I.M.S.
Superintendent of the Garden

CALCUTTA
SUPERINTENDENT GOVERNMENT PRINTING, INDIA
1912

NOTE.

THE map supplied with this fascicle is intended to be bound at the end of the volu me, but is given now so as to be immediately available. Botanists who intend to make use of this numerical list in the garden are advised to have the map cut along the folds and mounted on linen.

Although the garden is gone over systematically at intervals to replace tickets that have been lost or—as sometimes happens—maliciously or thoughtlessly torn off, still tickets that should be present may not always be found. In such cases the numbers of adjoining plants should give a clue to the missing ones. Since the ticketting of the plants was finished early in 1909 a number of plants have died, been blown over or cut out in the course of improvement of the garden. The numbers of such plants—that need not of course be looked for—are indicated in the list by a † after the name of each plant that has disappeared. A list of the numbers of plants that disappear is kept up to date in the Superintendent's office, and copies will be supplied—on application—to those who desire to use this list in the garden.

CATALOGUE OF NON-HERBACEOUS PHANEROGAMS CULTIVATED IN THE ROYAL BOTANIC GARDEN, CALCUTTA.

BY A. T. GAGE.

PART I.

INTRODUCTION.

The primary stimulus to attempt a compilation of the non-herbaceous flowering plants cultivated in the Royal Botanic Garden Calcutta, was the writer's ignorance and the not very exact knowledge of the other Garden officers of its contents. There were also other considerations that appeared to justify the attempt. The numerous letters received from within and from without India requesting copies of a catalogue of the plants cultivated, or seeking the information that should be contained in such a catalogue, indicate that the desire for a list of the plants cultivated in the Garden is not confined to the Garden staff.

Doubtless a botanical garden guiltless of a published or accessible list of its contents affords a considerable amount of both physical and mental exercises both to its officers and to such visitors as entertain an intelligent interest in its vegetation, but it is more than doubtful whether the chief function of a collection of living plants—apart from the spectacle they present—is merely to provide ground for such exercises, the benefits of which are so disproportionate to the time and energy consumed thereby. The desirability of as far as possible having every plant in the living collection correctly named and, though not necessarily labelled, yet so marked as to make the finding of both a plant itself and its name a matter of no or little more difficulty than a similar procedure with regard to a dried specimen in the Herbarium needs no demonstration.

The last published—as apart from merely printed—catalogue of the Garden is a small pamphlet of 12 pages, drawn up by the Curator of the Garden in 1871, in which merely a list of names is given. Previous to 1871 there had been a succession of catalogues, compiled at different times, from Roxburgh's *Hortus Bengalensis* published in 1814 to Anderson's Catalogue issued in 1865. In the second (Sys-

tematic) part of the present Catalogue these various catalogues will be referred to in more detail. But here it suffices to state that, with the exception of Roxburgh's *Hortus Bengalensis*, Wallich's Manuscript Catalogue and Voigt's Catalogue they are merely lists of plant names without any further information. A mere list of names is of course useful inasmuch as it, at least, shows what plants were cultivated in the Garden at the time of its publication, but such a list gives no help in discovering the situation of any particular species—not to mention plant—in the Garden, nor throws any light on the time or source of introduction, while it omits all reference to times of flowering, fruiting, habitat and such like facts.

It will be endeavoured in the present Catalogue to supply those deficiencies so far as opportunities allow, consistently with finishing the Catalogue within a reasonable time.

In drawing up a scheme for the present compilation it was considered essential that every non-herbaceous plant in the Garden—except in the case of groups or avenues of the same species—should have its own number, to be on no account repeated for any other plant even of the same species, and that it should be possible merely by referring to the number of a plant to obtain its name and also its place within narrow limits in the Garden. Further it was laid down that the Catalogue should show under each species cultivated the number of individuals, their individual numbers and the position of each individual in the Garden. It was impossible to fulfil all these conditions in one list so that the Catalogue is planned to consist of a numerical part and a systematic part.

Before it was possible to commence the actual enumeration and identification of the plants in the Garden a considerable amount of preliminary labour was necessary. In the first place the Garden had to be specially surveyed as the existing maps were inconveniently small, and, owing to recent changes in the *facies* of the Garden, no longer accurate. The survey was made under the writer's direction on the scale of 50 feet to the inch by Subodh Sen Gupta—formerly of the Civil Engineering College, Sibpur—during 1907-08, and a large map of the Garden was finished in the latter year. From this large map the one accompanying the present list has been reduced. As the Superintendents and Curators of other Gardens in India may have occasion at some time to compile catalogues of the plants in their restive Gardens, a detailed account of the operations followed in the preparation of the present list is given in the hope that it may be found feasible to adopt the same procedure or some modification of it.

The Garden was first divided—*on the map*—into squares of a hundred feet side, the lines of squares running due north to south and east to west. The north to south lines of squares were denoted by numbers and the east to west lines of squares by letters. Here and there throughout the Garden the intersections of the lines bounding those imaginary squares were fixed as follows. The intersections of the north to south and east to west lines forming part of the boundaries of four adjacent squares were selected, say the intersection of the line between rows 9 and 10 with the line between rows J. and K. A pit was dug over the exact intersection and a stout brickwork pillar built in the pit to hold firmly a strong iron post. The latter is T-shaped on section, both the head and the leg of the T being about 7·5 cm. (3″) across. Each post is about 7 feet long, the lower 3 feet being imbedded in the brickwork below the ground level and 4 feet projecting above the latter. Every post is so fixed that the flat surface (the head of the T on section) invariably points due north while the leg of the T points due south. On the flat or northward surface of each post is stamped—not painted—deeply into the metal the letters and numbers of the four surrounding squares. Thus, in the instance specified the post bears the letters J. K. and the Nos. 9, 10, signifying that the post marks the intersection of the squares J9, J10, K9, K10. Similar posts, properly lettered and numbered, are fixed at intervals of 200 to 600 feet or more along the same line between the rows 9 and 10 of north to south squares and along the line between the rows J. and K. of east to west squares. These posts are indicated on the map by small circles at the intersections of the squares where they occur. From a glance at the distribution of those posts throughout the Garden it will be seen that it would be comparatively easy to line out temporarily on the ground any required group or row or rows of squares. Altogether 77 posts have been erected.

The reader of the foregoing may possibly be inclined to picture the Garden as a rather peculiar spectacle with so many posts scattered about it. There is, however, no cause for such apprehension for there is really only one post to about every 3 acres and the sites of the majority of them were selected to be so well screened as to be practically invisible, while the posts themselves are painted a light bronze-green that blends well with the vegetation. On the other hand, anyone provided with the map on which those posts are marked would have no difficulty in finding them. Where it was impossible—as on an open piece of lawn—to effectively screen a post, the latter was cut off flush with the ground and an iron plate bearing the proper letters and numbers sunk over it.

Once the permanent marks were erected, the work of ticketing the trees, shrubs and climbers was begun in December 1908. From zinc sheets blank tickets were cut out, each ticket being 8 cm. long by 2 cm. broad to allow room for five or six figures in a line. Towards the right or lower end of each ticket the numbers were stamped, the actual figures being about 1·3 c.m. long—large enough to be easily read. The actual size of a ticket is represented in the adjoining figure.

8656

The tickets were numbered from 1 upwards consecutively and the actual ticketing was done in the following way. Every afternoon Mr. G. H. Cave, the officiating Curator of the Garden, selected a row or rows or a group of squares and from the permanent marks fixed the corners of the squares that were to be worked over the following morning and temporarily marked them with bamboo stakes. On the morning of the following day the Superintendent, the Curator of the Herbarium, the Curator of the Garden, several Indian assistants and some coolies took up operations. The coolies ran coarse tape from stake to stake so that each square in turn was temporarily lined out on the ground. Then every tree and shrub within the square had a numbered zinc label, nailed on or otherwise attached to it, invariably on the northern aspect, the numbers going on consecutively and irrespective of the order of the squares. Simultaneously, a list giving the numbers of the plants and their provisional identification, square by square, was drawn up. For about three months this work went on without a break until the whole Garden was gone over thoroughly and a rough list comprising over 13,000 trees and shrubs—every one of which can now be referred with comparative ease to its place in the Garden—was completed. In connection with this part of the work the writer desires to acknowledge the cheerful assistance rendered by Mr. G. H. Cave—on whom the heavy work of the preparation of the ground each day devolved—by Mr. W. W. Smith, M.A., Curator of the Herbarium, by Janardun Nasker, Assistant in the Herbarium, and by Mr. R. E. Cooper.

In going through the list to check the provisional identifications and to collect general information regarding time and source of introduction of each plant, the inadequacy of the older methods of registering such information has been forced upon the writer's attention. Time after time all efforts to trace the source of some particular

species or plant have failed because either any record that may have existed has been lost or is hidden in a huge mass of unindexed manuscript. The writer has therefore adopted a system which it is hoped will make it less of a task for future officers of the Garden to discover what information is already available regarding any plant or species and to add to that information. The system adopted is the one advocated by Dr. J. C. Willis, Director of the Royal Botanic Gardens, Peradeniya, Ceylon, in his paper "Studies in the Organization of a Botanical Department" (*Ann. Roy. Bot. Gard. Peradeniya, iii, Pt. I, p. 83.*)

Each numbered plant is provided with a Life-history Sheet. This is a double sheet of foolscap-size paper which when folded once gives 4 pages each 34·3 cm. (13½") long and 21·5 cm. (8½") broad. The following is a reduced reproduction of the first page of an actual sheet:—

CAT. HORT. BOT. REG. CALCUTTENSIS, 1909.

Extra Notes on Germination, Growth, Leaf-fall, Flowering, Fruiting, etc., should be written on one side of half-sheets with a two-inch margin on the left and half an inch on the right. The notes should be legibly signed (not merely initialled) and dated.

NO. & SQ. 239 (B 7).

ORDER & NAME. Nyctagineae.

Bougainvillaea spectabilis *Willd.*

SOURCE AND HISTORY.—From Garden stock, planted in 1906. Climbing on *Casuarina equisetifolia* No. 238 and flowering freely since 1909.

A. T. GAGE,
The 3rd March 1910.

For the majority of the plants already in the Garden little information is easily accessible regarding source or history, but there should be less chance of *lacunæ* in recording future accessions.

As the number fixed to each plant planted out in the Garden and printed on its life-history sheet is its permanent number—never to be repeated for any other plant,—separate provision had to be made for the registration of seeds and young plants still in the nurseries. For this the system adopted is practically the same as for planted-out plants. Each packet or single consignment of seeds of one species or young plant received into the nursery from outside or any seed of a specially important plant from within the Garden is provided with a "Seed Sheet." Each single consignment of seed and its sheet bears the same number, the numbers being given consecutively as the seeds or young plants are received in the nursery, no number ever being repeated for any other consignment even of the same species. These seed sheets are the same size and arranged similarly to the plant life-history sheets. The following is a reduced copy of first page of an actual sheet :—

ROYAL BOTANIC GARDEN, CALCUTTA.

SEED SHEET NO. 305.

For notes on seeds received from outside the Garden and special seeds within it, from receipt of seeds until planting out.

NAME & ORDER. Cyrtostachys Lakka *Becc.*

(Palmæ).

SOURCE & HISTORY.—Received from the Botanic Garden, Penang, on 3rd January 1910.

Both the life-history sheets and the seed sheets are filed in duplicate, one copy of each going to the Curator of the Garden and the other being retained in the Superintendent's office. The seedlings and young plants derived from any given consignment of seeds of one species retain, while in the nursery, the same number given to the

seeds from which they sprang. When the plant—or several plants if of the same species and intended to form a compact group—is taken from the nursery to be permanently planted out in the Garden, it receives its permanent number, a zinc label with this number stamped on it is fixed on the plant, and a life-history sheet bearing the same permanent number and the letter and figure or figures of the square in which the plant has been planted out is filled in, all the information given on the seed sheet being transferred under the secondary heading "Source and History" to the life-history sheet. In this way every plant hereafter planted out should start with its life-history recorded up to the date of planting out and it will be the duty of the officers of the Garden to see that the record is continued.

The life-history sheets are arranged consecutively according to their numbers in bundles of 50 in vertical-file cabinets. Each bundle of 50 is contained in a stout brown paper cover on which is printed, in bold type, the numbers of the first and last sheet it contains; thus "Garden Cat. Nos. 401-450." It is thus quite easy to pick out at once the life-history sheet of any plant in the Garden.

In numbering the plants it was obviously impossible to arrange for the numbers in adjoining squares, both north to south and east to west being consecutive. For practical reasons it was most convenient to work off either an irregular group of squares at a time, such as those on any of the tongues of land projecting into the lakes, or a single row of squares or a double row. Thus the numbers in square K 7 are amongst the second and third centuries, whereas those in square K 8 are in the second thousand. At present all the numbers within a given square are consecutive within that square. As, however, a number once given is never to be repeated, it follows that the numbers—necessarily always higher and higher—of the plants planted out hereafter will bear no close ordinal relation to the numbers of the plants already in the squares in which the new plants will be planted. So in the future one may find, say, No. 14025 amidst plants bearing numbers in the centuries only. So long, however, as the square letter and figure or figures as well as the actual number of the plant are quoted in every reference to the plant, the approximate position of the latter in the Garden is indicated, however mixed up the numbers may be.

The numerical list is arranged in the order of the plant numbers grouped in squares irrespective of the alphabetical or numerical sequence of the squares themselves, but to facilitate cross reference an index to the squares will be given in each part of the list and a complete index of squares when the numerical list is finished. Several

copies of the list printed on one side of the paper will allow of special files of the list, arranged in the orders of the squares, being preserved in the office of the Superintendent and Curator of the Garden, respectively.

The system is simple and should be effective, but it is not automatic and its ultimate success will depend on and be a test of the interest of present and future officers of the Garden in their immediate work. The writer, however, is confident that the introduction of the system will be found to have been justified.

Every one of the plants indicated by the numbers in the list has been collected and carefully examined by the writer but every plant is not named. In any instance in which there has been insufficient material to make specific identification certain, the writer has given the genus only, where it has been possible to be sure of it, or has left a blank. It was deemed essential to whatever value the list may have that there should be no doubt of what is believed to be correct and what is uncertain. The rigid maintenance of this censorship has meant a good many blanks in the list at present, but an indication of what is not known may be not much less useful than a statement of what is known and the blanks should serve as signals for the attention of Garden officers and scientific visitors. Sufficient space is left for each blank to be filled in in manuscript at any future time. Although every name given is believed by the writer to be correct he is no less fallible than most men and it is not at all improbable that a fair number of misidentifications may be detected by those who use this list. The writer would be under much obligation to anyone who would bring such misidentifications to his notice. The right half of each page is left blank to allow all errors being recorded or corrected.

The first part of the Catalogue is merely an index and the real "stock account" of the Garden will appear in the second or systematic part. Still it is hoped that even the index will be an aid both to Garden officers and visitors interested in tropical vegetation by which they may find the Garden somewhat less of a strange forest than hitherto.

As the primary object of this list as far as the Indian species are concerned is to facilitate recognition of living plants by those accustomed to the use of Hooker's Flora of British India and such local Indian Floras as have been based thereon, the generic names are not in every case according to the most recent fashion, but this should make the list none the less, and possibly all the more, of practical use. For non-Indian species the *Index Kewensis* has been used as the main standard of reference throughout.

NUMERICAL LIST.

The plants are grouped according to the squares which are indicated by the letters and figures in bold type in the vertical centre line. The numbers in small type on the left side are the index numbers of the plants.
